

CARDIAC SURGERY IN PENNSYLVANIA 2006-2007

Information about Hospitals and Cardiothoracic Surgeons

PENNSYLVANIA HEALTH CARE COST CONTAINMENT COUNCIL
August 2009

About PHC4

The Pennsylvania Health Care Cost Containment Council (PHC4) was established in 1986 as an independent state agency by the General Assembly and the Governor of the Commonwealth of Pennsylvania. To help improve the quality and restrain the cost of health care, PHC4 promotes health care competition through the collection, analysis and public dissemination of uniform cost and quality-related information.

Key Findings	1
Understanding this Report	5
Hospital Data	10
Surgeon Data	26

Key Findings

Mortality – Valve Surgery

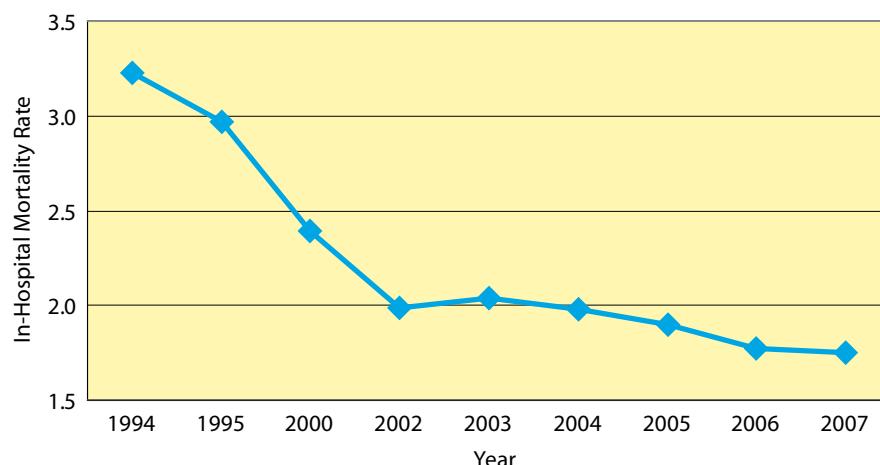

- From 2005 (the first year that valve surgeries were reported) to 2007, in-hospital mortality for the total valve reporting group (i.e., valve procedures with or without a CABG procedure) dropped 23.9 percent, from 5.15 percent in 2005 to 3.92 percent in 2007.
- Valve without CABG in-hospital mortality rates increased from 3.02 percent in 2005 to 3.33 percent in 2006 and then decreased to 3.19 percent in 2007.
- Valve with CABG in-hospital mortality rates had the largest decrease, 36.1 percent, from 7.47 percent in 2005 to 4.77 percent in 2007.

Note: This table includes data for each year that PHC4 published analysis for valve procedures.

Mortality – CABG Surgery

- For patients undergoing coronary artery bypass graft (CABG) procedures (without a valve procedure), in-hospital mortality rates declined slightly from 1.77 percent in 2006 to 1.75 percent in 2007. CABG mortality rates have dropped 45.8 percent since 1994.

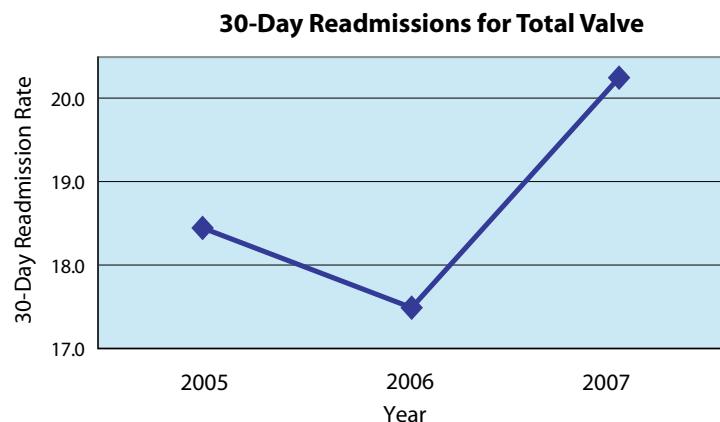

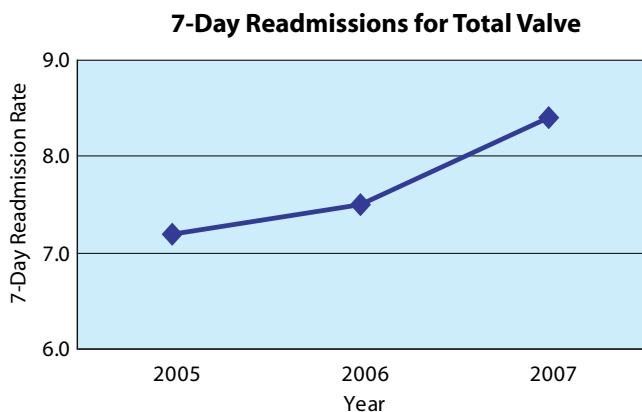

Note: This table includes data, beginning with 1994, for each year that PHC4 published analysis for CABG procedures.

Key Findings

Readmissions – Valve Surgery

- For the total valve reporting group (i.e., valve procedures with or without a CABG procedure), 7-day readmissions increased between 2005 and 2007, from 7.17 percent in 2005 to 7.49 percent in 2006 to 8.38 percent in 2007.
- Thirty-day readmissions for the total valve reporting group (i.e., valve procedures with or without a CABG procedure) decreased between 2005 and 2006 (18.44 percent to 17.50 percent) and then increased in 2007 to 20.26 percent.

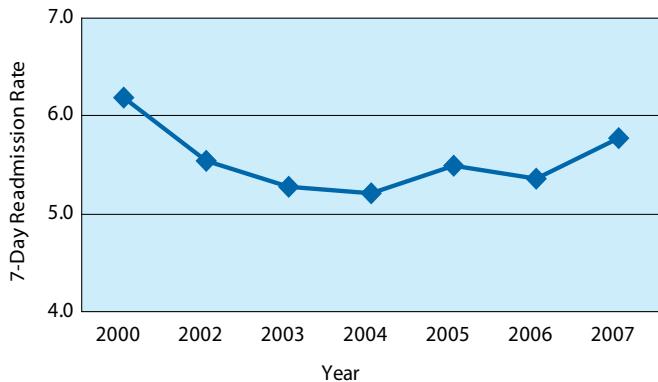

Note: The tables above include data for each year that PHC4 published readmission rates for valve procedures.

Readmissions – CABG Surgery

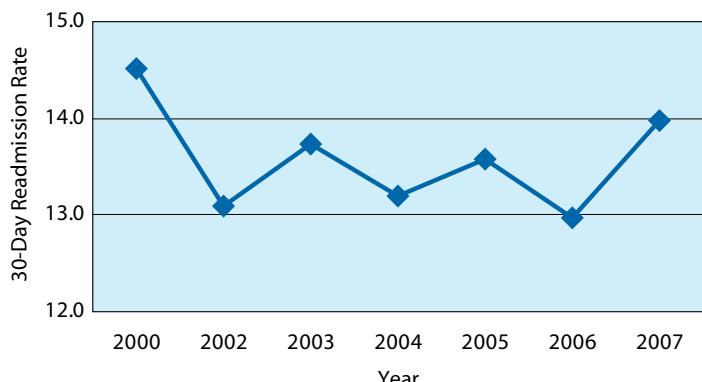

- For patients undergoing CABG procedures (without a valve procedure), rates for readmissions within 7 days of discharge increased between 2006 and 2007, from 5.36 percent to 5.77 percent. Overall, between 2000 (when readmissions were first reported) and 2007, 7-day readmission rates decreased 6.6 percent, from 6.18 percent to 5.77 percent.
- Between 2006 and 2007, readmission rates within 30 days of discharge for CABG procedures (without a valve procedure) increased from 12.97 percent to 13.98 percent. While 30-day readmission rates fluctuated for the years reported between 2000 and 2007, there was an overall decrease of 3.7 percent, from 14.52 percent to 13.98 percent.

Key Findings

7-Day Readmissions for CABG without Valve

30-Day Readmissions for CABG without Valve

Note: The tables above include data for each year that PHC4 published readmission rates for CABG procedures.

Reasons for Readmissions

- For patients undergoing CABG procedures (without a valve procedure) from 2000 through 2007, the top reason for readmissions within 7 days has fluctuated between infections and heart failure.
- Infection has consistently been the top reason that patients have been readmitted within 30 days of CABG (without a valve procedure) from 2000 through 2007.
- For patients undergoing valve procedures (with or without CABG) from 2005 through 2007, heart failure has been the top reason that patients have been readmitted within 7 days and 30 days, followed by either infection or abnormal heartbeat (cardiac dysrhythmias).

Volume for Open Heart Surgery

- Between 2006 and 2007, the average number of open heart procedures performed by cardiothoracic surgeons declined from 114 cases per surgeon to 108 cases per surgeon—down from 149 in 2000. The average number of open heart procedures per hospital declined from 330 cases per hospital to 315 cases per hospital between 2006 and 2007—down from 499 in 2000.

Key Findings continued on page 4 ➤

Key Findings

Hospital-Acquired Infections

From 2006 to 2007, there was a 5.4 percent drop in the percent of patients who contracted infections while in the hospital for CABG and/or valve surgery. For 2007, hospitals reported that of the 15,655 patients who underwent these cardiac procedures, 933 (5.96 percent) contracted an infection¹ during their stay, a decrease from the 1,048 (6.30 percent) of hospital-acquired infections reported by hospitals for patients undergoing these procedures in 2006.

Consistent with the findings in 2006, in 2007 patients who underwent both CABG surgery and a valve procedure during the same hospitalization were the most likely to contract a hospital-acquired infection (10.14 percent), and patients who underwent CABG with no valve procedures were the least likely to contract a hospital-acquired infection (4.66 percent).

The following table displays the differences in outcomes for patients who did and those who did not contract an infection during their hospital stay. The degree to which the presence of hospital-acquired infections influenced these differences is not known.

Patients...	In-Hospital Mortality Rate	Average Post-Surgical Length of Stay		Average Hospital Charge ⁴	
		Mean ²	Median ³	Mean ²	Median ³
With a Hospital-Acquired Infection	11.4%	21.5 days	16.0 days	\$366,342	\$256,744
Without a Hospital-Acquired Infection	1.9%	7.0 days	6.0 days	\$136,924	\$101,967

1 In 2006 and 2007, hospitals submitted data on the following hospital-acquired infections: urinary tract, pneumonia, bloodstream, surgical site, gastrointestinal, bone and joint, central nervous system, cardiovascular system, lower respiratory system (other than pneumonia), reproductive system, and skin and soft tissue infections.

2 This is an arithmetic mean, which is used to demonstrate the difference between actual averages for patients with and without hospital-acquired infections.

3 The median demonstrates the difference between the actual mid-ranges for patients with and without hospital-acquired infections.

4 In almost all cases, hospitals do not receive full charges from private insurance carriers or government payors; on an average basis, across all inpatient hospital cases statewide, hospitals are reimbursed or paid for approximately 27 percent of established charges.

Understanding this Report

What is coronary artery bypass graft surgery and what is heart valve surgery?

Coronary artery bypass graft (CABG) surgery is a surgical procedure used to treat patients with blockages in the coronary arteries. During the procedure, a surgeon creates an alternate path for blood to flow to the heart muscle by going around, or bypassing, a blocked section of an artery. CABG is typically recommended for severe blockages that are not treatable by other methods. After the procedure is completed, most patients stay in the hospital for several days and face a prolonged rehabilitation period.

Valve surgery is a surgical procedure used to replace or repair one or more of a patient's heart valves. Valve surgery is used to treat patients with congenital (present at birth) heart disease, degenerative (age-related "wear and tear") disease and conditions such as rheumatic heart disease. In valve replacement surgery, the

diseased valve is removed and replaced with an artificial (mechanical) valve or a biological valve harvested from animal or human tissue. In valve repair surgery, the technique is dependent on the underlying cause of the disease.

Why is it important to look at CABG and valve surgeries?

CABG and valve surgeries are frequently performed and costly surgeries. This report includes information on approximately 32,000 CABG and/or valve surgeries performed in Pennsylvania general acute care hospitals in 2006 and 2007.

Although most CABG/valve patients have an excellent prognosis for survival, results following surgery may vary among hospitals and surgeons. There is evidence that information contained in reports such as this encourages hospitals and surgeons to examine their processes and make changes that can improve quality of care and ultimately save lives.

What is measured in this report and why are these measures important?

Outcome measures for this report were chosen because they are important components in examining quality of care. Further, they can be reliably measured and compared across hospitals. This report includes information on the number of surgeries performed, in-hospital and 30-day mortality rates, readmission rates within 7 and 30 days, and data on post-surgical lengths of stay for both hospitals and surgeons, as well as hospital average charges for hospitals only. Unlike last year's report, Medicare average payments for hospitals are not included because the data for 2007 was not available from the Centers for Medicare and Medicaid Services. The reporting groups are divided as follows:

- **CABG without Valve** comprises patients who had at least one CABG procedure without any valve procedures during the same admission.

- **Valve without CABG** comprises patients who had at least one valve procedure without any CABG procedures during the same admission.
- **Valve with CABG** comprises patients who had at least one valve procedure and at least one CABG procedure during the same admission.
- **Total Valve** comprises patients who had at least one valve procedure with or without a CABG procedure during the same admission.

Number of cases is reported for all hospitals and surgeons. Information on CABG/valve results is reported for the hospitals and surgeons who performed 30 or more procedures on adults in at least one of the four reporting groups in 2006 and 2007. Surgeon outcomes are based on two years of combined data, 2006 and 2007. The resulting increase in volume of cases per surgeon results in a more robust analysis. Hospital outcomes are reported for the combined 2006 and 2007 data and for 2007 data only. Average hospital charge is reported

for hospitals that had at least 13 cases in a particular reporting group.

Number of cases – This is the number of surgeries analyzed in this report. The cases are divided into four reporting groups: CABG without valve, valve without CABG, valve with CABG and total valve. It is important to note, however, that some CABG/valve patients were not counted in this analysis (for example, those that underwent other complex procedures during the same hospital admission as the CABG/valve surgery and procedures done in Veterans' hospitals and in other states), so the actual number of cases that a hospital or surgeon treated might be higher.

In-hospital mortality – This measure represents the number of patients who died during the hospital stay in which the CABG/valve surgery was performed.

30-day mortality – This measure represents the number of patients who either 1) died during the hospitalization in which the CABG/valve surgery was performed,

even if it was after 30 days, or 2) died after discharge, but within 30 days of the procedure. The data used for this analysis does not clearly characterize whether a patient's death within 30 days was related to the CABG/valve surgery, so there may be deaths included in the analysis that were unrelated to the surgery. Deaths clearly caused by unusual circumstances, such as those related to motor vehicle accidents or suicides, were excluded.

7-day and 30-day hospital readmissions – These measures examine how often patients were readmitted to a Pennsylvania general acute care hospital within 7 days or 30 days of being discharged from the hospital where the CABG/valve surgery was performed. A readmission was counted only if the patient was readmitted with a principal diagnosis that indicated a heart-related condition, or an infection or a complication that was likely related to the CABG/valve surgery hospitalization. Readmissions for other reasons were not included

in the analysis. Readmission rates are important from both a quality of care and cost standpoint.

Information on both 7-day and 30-day readmissions is reported because the reasons for readmission may vary across these time periods. Seven-day readmissions account for those readmissions that are closer in time to the initial hospitalization and may be more directly related to the CABG/valve surgery hospitalization. At the same time, some complications may occur after the first 7 days; therefore, including 30-day readmission rates provides a more complete picture.

Post-surgical length of stay – This measure represents how long a patient stayed in the hospital after undergoing CABG/valve surgery and is reported in average days. The average reported is the geometric mean. (Geometric means are the result of the natural log transformation that was done to adjust for skewness in the distribution. See the Technical Notes for a more detailed explanation of geometric means.) While com-

plications following surgery were not examined for this report, other analysis has shown that complications following CABG/valve surgery add to the length of time a patient stays in the hospital.

Hospital average charge – The amount a hospital bills for a patient's care is known as the charge. The charge includes the facility fee but does not include professional fees (e.g., physician fees) or other additional post-discharge costs, such as rehabilitation treatment, long-term care and/or home health care. Where hospital charges are concerned, in almost all cases, hospitals do not receive full charges from private insurance carriers or government payors. In fact, on an average basis, across all inpatient hospital cases statewide, hospitals are reimbursed or paid for approximately 27 percent of established charges.¹ Hospital charges often vary by individual hospital and by regions of the state. The average charge reported is for the entire length of stay. A hospital's cost for the stay is an amount that is

different from the charge and the payment.

Uses of the report

This report can be used as a tool to examine hospital and surgeon performance for CABG/valve surgery. It is not intended to be a sole source of information in making decisions about CABG/valve surgery, nor should it be used to generalize about the overall quality of care provided by a hospital or a surgeon. Readers of this report should use it in discussions with their physicians who can answer specific questions and concerns about CABG/valve surgery.

- Patients/consumers can use this report to aid in making decisions about where and with whom to seek treatment involving CABG/valve surgery. This report should be used in conjunction with a physician or other health care provider when making decisions about CABG/valve surgery.
- Group benefits purchasers/insurers can use this report as part of a process in deter-

¹ The statewide/regional revenue-to-charge ratios are derived from the annual net inpatient revenue and inpatient charges provided by each hospital as part of their annual financial filings to PHC4.

mining which hospitals and surgeons provide quality care for employees, subscribers, members, or participants who need CABG/valve surgery.

- Health care providers can use this report as an aid in identifying opportunities for quality improvement and cost containment.
- Policymakers/public officials can use this report to enhance their understanding of health care issues, to raise public awareness of important issues and to help constituents identify health care options.
- Everyone can use this information to raise important questions about why differences exist in the quality and efficiency of care.

Where does the data come from?

Most of the data used for this report was submitted to PHC4 by general acute care hospitals that perform CABG/valve surgery. It encompasses inpatient hospital discharges from January 1, 2006

to December 31, 2007 in which the patient underwent CABG/valve surgery. The data submitted to PHC4 by the hospitals was subject to verification for accuracy by the hospitals, surgeons and PHC4. The ultimate responsibility for data accuracy and completeness lies with each individual hospital. The Pennsylvania Department of Health provided data used to analyze the 30-day mortality measure.

Accounting for high-risk patients

Some patients who undergo CABG/valve surgery are more seriously ill than others. Hospitals provided data on "how sick the patient was on admission." This information is used to make sure that differences in the illness level of patients are accounted for when reporting information on CABG/valve surgery.

In order to report fair comparisons among hospitals and surgeons, PHC4 developed a complex mathematical formula to "risk-adjust" the data, mean-

ing that hospitals and surgeons receive "extra credit" for operating on patients that are more seriously ill or at a greater risk than others. Risk-adjusting the data is important because sicker patients might be more likely to die following CABG/valve surgery, stay in the hospital longer, or be readmitted. A comprehensive description of how these adjustments are made can be found in the Technical Notes document that accompanies this report. It can be found on PHC4's Web site at www.phc4.org.

What do the symbols mean?

The symbols in this report represent the results of how well hospitals and surgeons performed surgery and cared for the patient. A statistical test is done to determine whether differences in the results are simply due to chance or random variation. A difference is called "statistically significant" when there is 95 percent confidence that the difference is not likely to result from chance or

random variation. Using in-hospital mortality as an example:

- lower than expected (meaning that the hospital or surgeon had fewer deaths than expected after accounting for how sick the patients were)
- same as expected (meaning that the hospital or surgeon had as many deaths as expected after accounting for how sick the patients were)
- higher than expected (meaning that the hospital or surgeon had more deaths than expected after accounting for how sick the patients were)

Acknowledgements

PHC4 wishes to acknowledge and thank the Pennsylvania hospitals and surgeons who participated in the data submission and verification processes used for this report.

PHC4 thanks the Bureau of Health Statistics and Research, Pennsylvania Department of Health, Harrisburg, Pennsylvania,

for providing information used in the 30-day mortality measure.

The Pennsylvania Department of Health specifically disclaims responsibility for any analyses, interpretations or conclusions.

TABLE NOTES

For Hospital and Surgeon Data - 30-day mortality includes in-hospital mortality. The mortality, readmission, and length of stay figures account for varying illness levels among patients. Length of stay is the average number of days spent in the hospital following CABG/valve surgery.

For Hospital Data Only - Average charge is for the entire length of stay. Average charge was trimmed and case-mix adjusted. Note that in almost all cases, hospitals do not receive full charges from private insurance carriers or government payors; on an average basis, across all inpatient hospital cases statewide, hospitals are reimbursed or paid for approximately 27 percent of established charges.

For Surgeon Data Only - The actual number of CABG/valve surgeries performed may be under-reported (e.g., cases excluded for clinical complexity and procedures done in Veterans' hospitals and in other states are not included in this analysis). Total figures on all open heart surgeries (including CABG/valve) performed in Pennsylvania hospitals are available on PHC4's Web site.
